

## Remote sensing data processing at the Institute of Electronics and Computer Science (EDI)

Ints Mednieks  
[mednieks@edi.lv](mailto:mednieks@edi.lv)

# Facts and numbers about EDI

**Founded**  
:  
1960

**Location:**  
Riga, Latvia

**Personnel**  
:  
130+

**Building area:**  
16 000 m<sup>2</sup>

**No. of Labs:**  
6

Signal Processing Lab.  
Space Technology Lab.  
Robotics and Machine perception Lab.  
Cyber-Physical systems Lab.  
Integrated circuit and systems Lab.  
**Energy research center (Lab.)**

**Equipment:**  
Multi-million  
state of the art  
equipment

**International evaluation:**  
Highest rated institute in  
Latvia in the field of  
engineering and  
technologies

**Collaboration:**  
500+ scientific and  
industrial partners  
worldwide

# Remote sensing group of EDI

## Development and software implementation of custom methods for image processing

- Finished projects
  - Identification of tree species by processing multispectral and LiDAR data (2009-2011) **Contracts with industry**
  - **Dviete** - Discrimination between meadow habitats (finding diversity of plants) (2011-2012) **EU LIFE+ project**
  - **InBiT** - Biomedical image processing (2013- 2015)
  - **GudPils** – remote sensing image processing for smart cities (2014-2017)
  - **DynLand** - Dynamic land use monitoring by fusion of satellite data (2016-2019)  
**European Space Agency (ESA) project**
  - **WoodStock** - Satellite remote sensing- based forest stock estimation technology (2019-2022) **ERDF**
  - **Dynland-2** - Object based context aware self-learning network for land cover classification (2021-2022) **ESA project**
  - **MireClass** - Automated identification of mires and peatlands using multi-temporal satellite data (2019-2021)  
**ESA project**
  - **ForestRisk** - Remote sensing based system for forest risk factor monitoring (2022-2023) **ERDF**
  - **SentiMap** - Sentinel for confidence in outdated maps (2022-2023 ) **ESA project**
  - **EO BALP** - EO Baltic Platform For Governmental Services (2023-2025 ) **ESA project**
- Ongoing projects
  - **Waterfront** - Monitoring urban waterfront and recreation territories (2024-2025) **ESA project**
  - **HYLIFORES** - Comprehensive analysis of hemiboreal forest structure, species composition and ecosystem services using VHR hyperspectral and LiDAR data (2025-2027) **grant from Latvian Council of Science**

# Dynland - Dynamic land use monitoring by fusion of satellite data (2016-2019)

**Development of Dynland™ technology for semi-supervised classification of data**

## Dynland classification

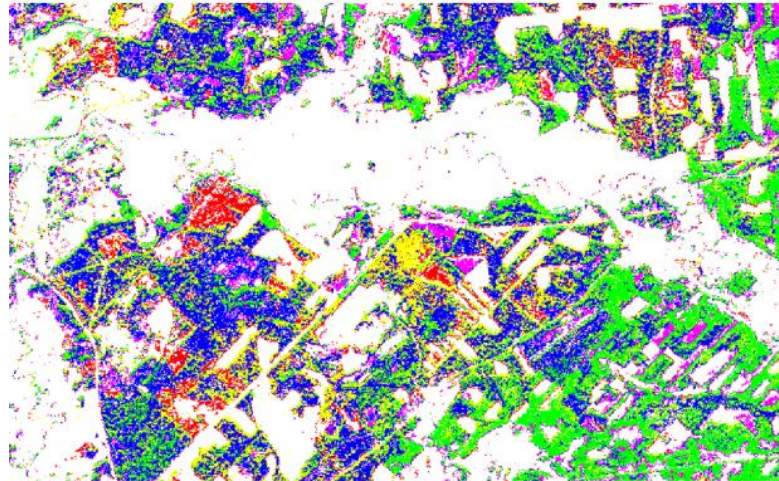

### Step 1

**Non-parametric** iterative clustering  
of multidimensional data

### Step 2

Automatic assignment of classes to  
clusters based on reference data or  
rules

## Detailed classification of coniferous forest

White:  
no coniferous forest

Coniferous forest:

-  Spruces
-  Pines
-  Young coniferous trees
-  Sparsely growing coniferous trees
-  Sparsely growing pines with young forest underneath

**Publication:** R.Dinuls, I.Mednieks “Nonparametric Classification of Satellite Images.” Proceedings of the 2018 International Conference on Mathematics and Statistics. ACM, New York, NY, USA, 2018, pp. 64-68.  
DOI:[10.1145/3274250.3274260](https://doi.org/10.1145/3274250.3274260).

# WoodStock –

## Satellite remote sensing- based forest stock estimation technology (2019-2022)

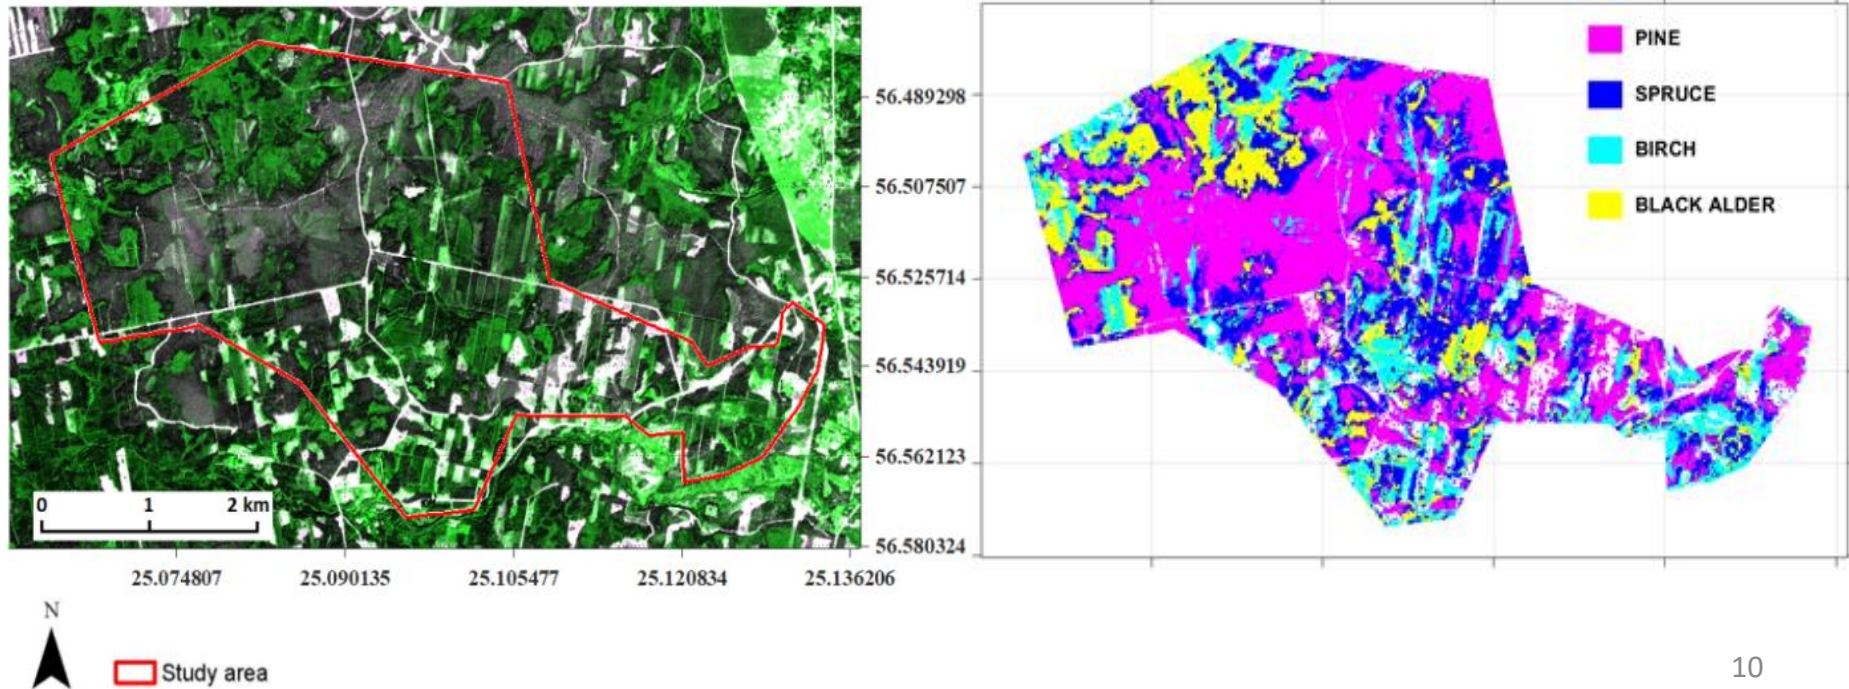

The project is focused on the development of the prototype technology for **estimation of forest stock volume** from high-resolution satellite data, including methods for:

- identification of **tree species**
- automated **delineation of microstands**
- estimating **stock volume**

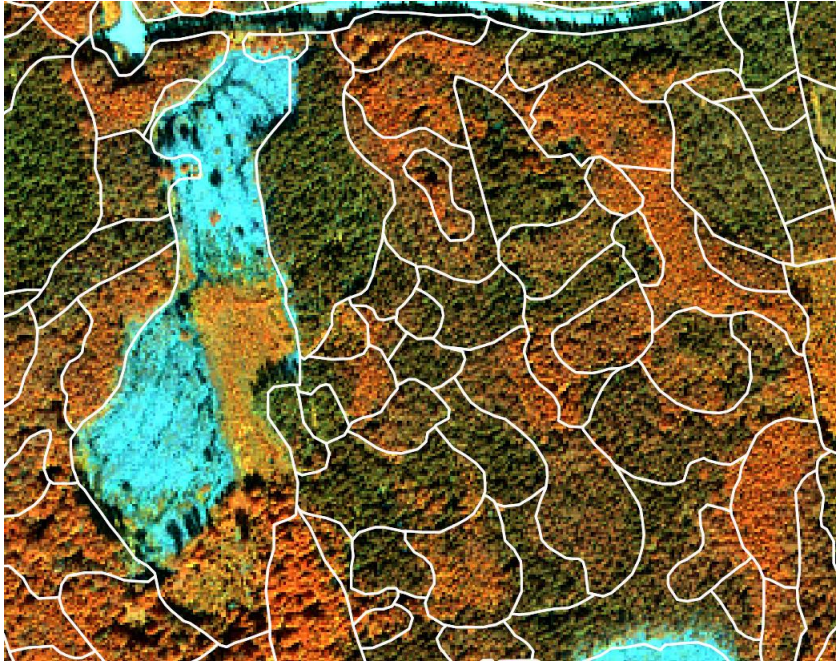

# WoodStock

Tree species classification from Sentinel-2 data  
using deficient (sparse, outdated) inventory data

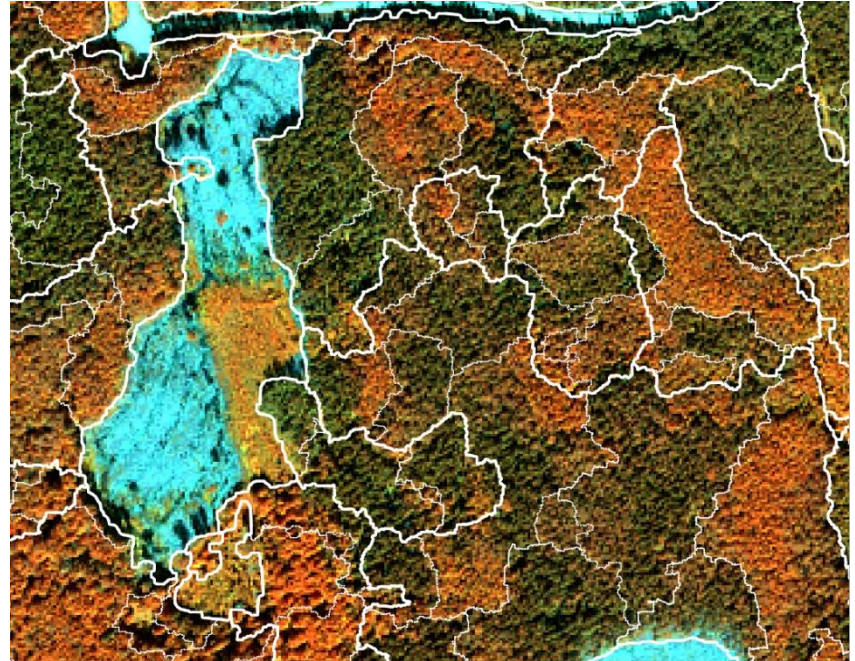

# WoodStock

**Automated delineation of microstands in hemiboreal mixed forests  
using GeoEye-1 data and a JSEG-based workflow**

Manual delineation by an expert using orthophoto

Automatic delineation in 2 stages (CHM, MS data)

European Space Agency

## **Automated identification of mires and peatlands using multi-temporal satellite data (MireClass) 2019-2022**

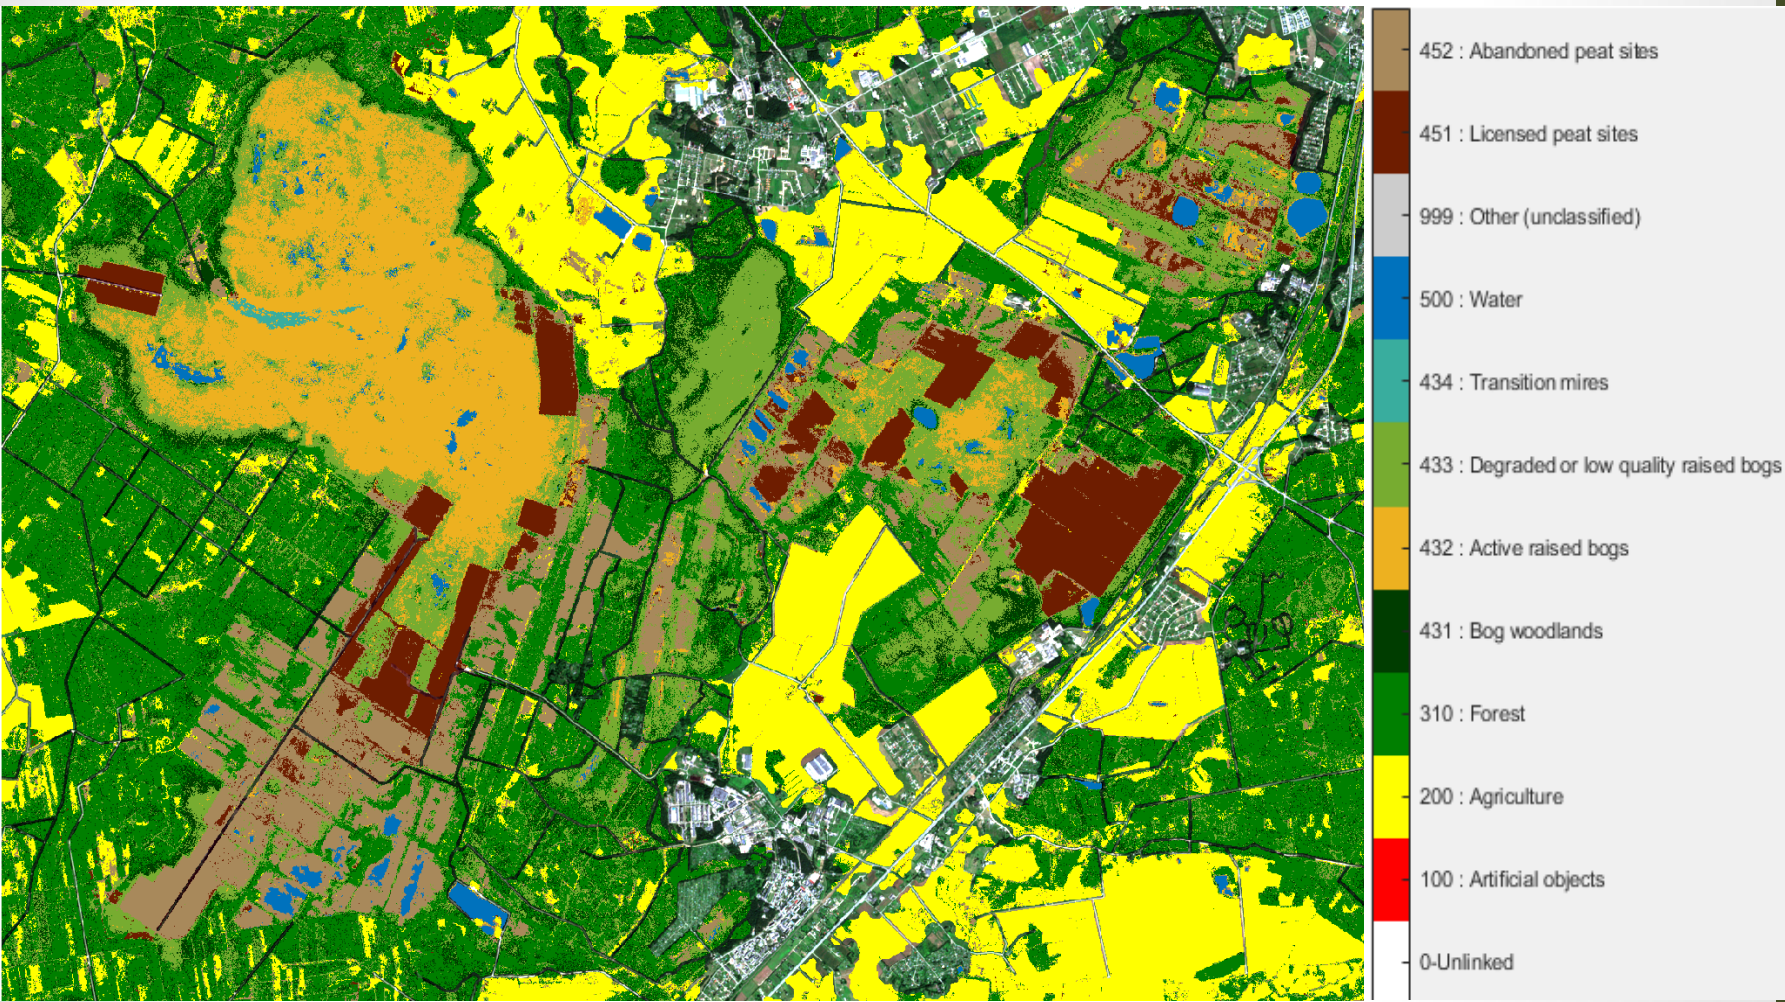

**Goal: To develop MireGIS system for classification of mires and peatlands**

**Prime contractor: Institute of Electronics and Computer Science**

**Subcontractor: SIA «SWH SETS» (SETS)**

## Results based on Sentinel-2 imagery from 3 different seasons + CHM + TreeCover

# Object based context aware self-learning network for land cover classification (Dynland-2) 2021-2022

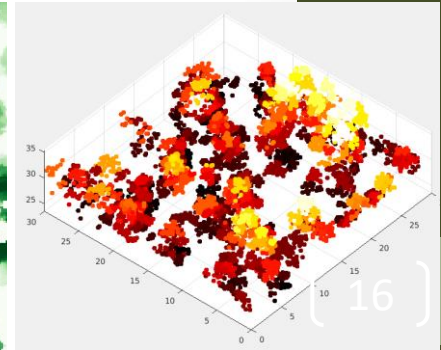

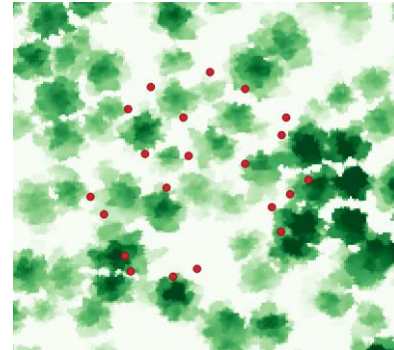

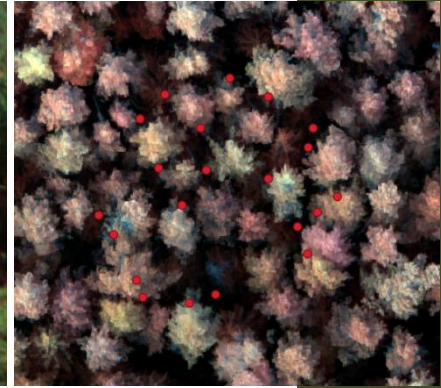

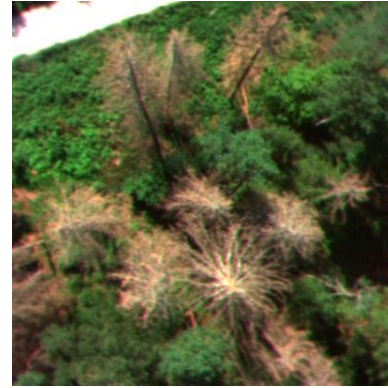

# ForestRisk –

## Remote sensing based system for forest risk factor monitoring (2022-2023)

**Objective:** to develop software tools for assessment, monitoring and alerting of forest risk factors using satellite and unmanned aerial vehicle (UAV) based remote sensing

### Main directions:

1. **Monitoring** of forests from satellites
2. Detection of risk areas from **VHR** remote sensing data (NIR-RGB, LiDAR, Hyperspectral)

# Sentinel for confidence in outdated maps (SentiMap ) 2022-2023

**Objective:** to build a technology prototype for detection of outdated areas in aerial images and land cover maps using satellite and VHR imagery

## Directions:

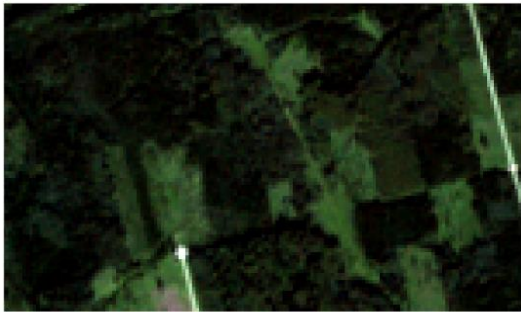

1. Identifying outdated areas in VHR aerial imagery
2. To detect change probability

## SentiMap tool for change detection as anomaly

- Use unsupervised anomaly detector to create outdated information layer
- Calculate probability that the area mapping is outdated & apply threshold

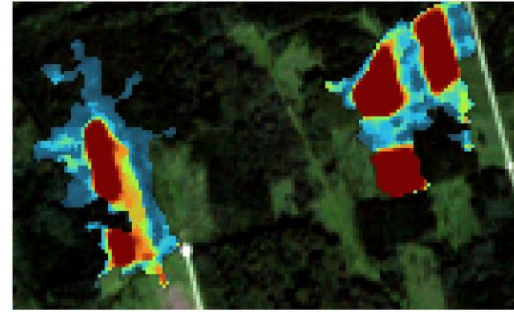

Sentinel-2 image (outdated) - Sentinel-2 image (up-to-date) sample

(a) 2016

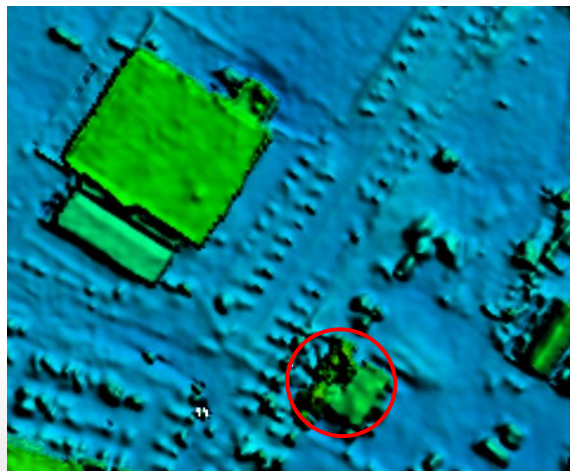

(b) 2020

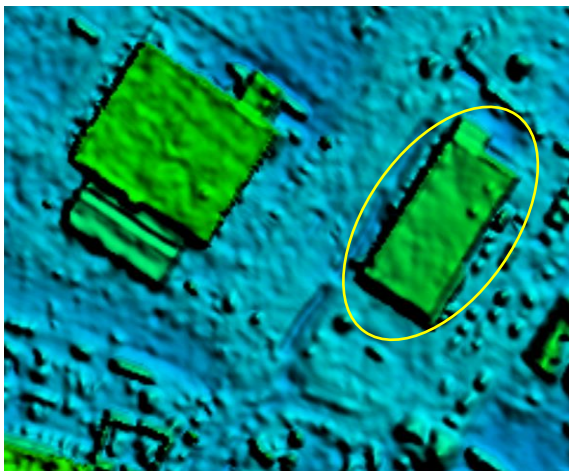

(c) Outdated information layer

## SentiMap tool for change detection by using image-based DSMs height differencing

The tool applies a morphological filter for height differencing between any (LiDAR, image-based) digital surface models with the goal of change detection mask creation for urban and rural areas for topographic map updating.

DSM (1m GSD) 2019

DSM (1m GSD) 2022

## **EO BALP - EO Baltic Platform For Governmental Services (11.2023-05.2025 )**

**Goal: to develop EO Baltic Platform For Governmental Services and provide six main platform components**

**EDI task: develop Natural Resource Extraction Monitoring service**

**Main contractor: Baltic Satellite Service (Latvia)**

**Subcontractors : DATEL (Estonia)**

**Klaipeda University (Lithuania)**

**Institute of Electronics and Computer Science (Latvia)**

**Rural Support Service (Latvia)**

European Space Agency

## Waterfront - Monitoring urban waterfront and recreation territories (10.2024 – 12.2025)

**Goal:** To provide tools for more frequent and more precise monitoring of urban waterfront territories compared to Copernicus services

**Objectives:**

- To develop and evaluate deep learning-based land cover class fraction estimation from Sentinel-2 data
- To develop a tool for reed and algae detection in water basins

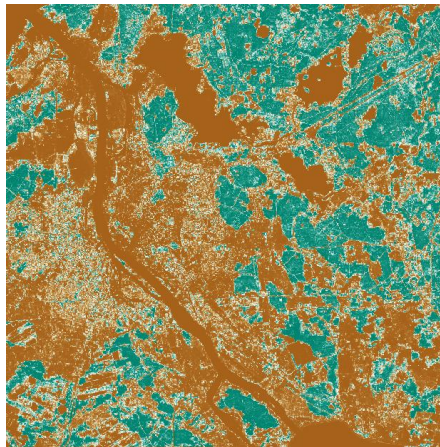

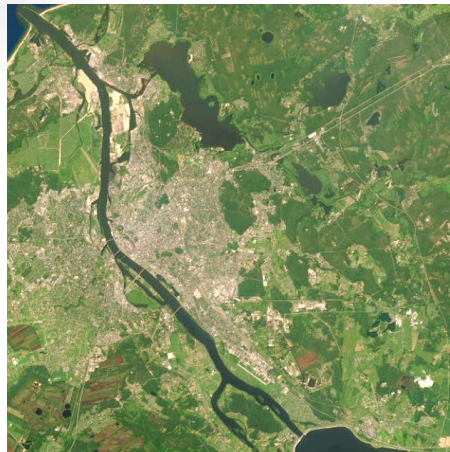

**Prime contractor:** Institute of Electronics and Computer Science

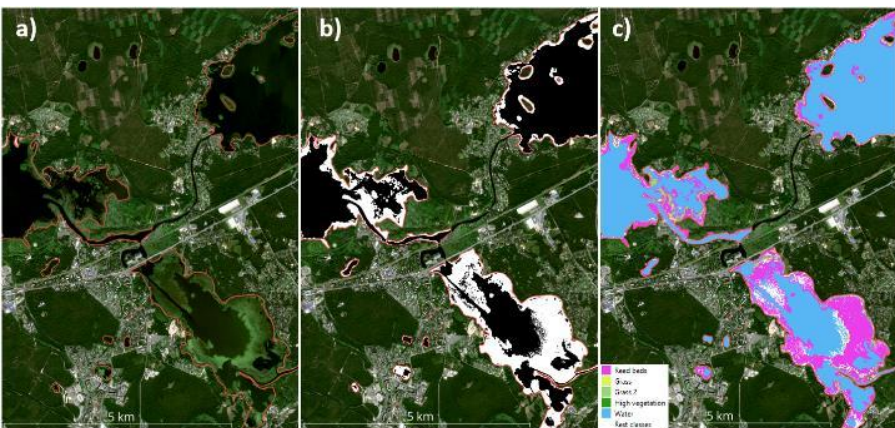

**Subcontractor:** SIA Rīgas meži

# Custom CNN for Tree Cover Density fraction estimation

## Water/Non-water classifier

## Chlorophyll *a* content estimator

# **HYLIFORES - Comprehensive analysis of hemiboreal forest structure, species composition and ecosystem services using VHR hyperspectral and LiDAR data (2025-2027)**

**Main contractor: LSFRI Silava**

UAV DJI Matrice 350 RTK

Hyperspectral snapshot camera Cubert Ultris X20 Plus

# Our competence

1. Object detection and classification in images
2. Processing data from various sensors including fusion (RGB, multispectral, hyperspectral, LIDAR)
3. Custom solutions based on dedicated remote sensing data processing methods and software
